

IN THE CLAIMS:

1. (Previously Presented) A method of determining the service life of a fluid power cyclic system comprising the steps of:

determining at least one characteristic of the cyclic system to determine a characteristic value, wherein the characteristic value is a flow rate of the system;

determining a cycle time of the cyclic system;

applying the flow rate to an algorithm in which the characteristic value is integrated over the cycle time to determine a diagnostic value; and

comparing the diagnostic value to a predetermined value to determine the service life status of the cyclic system.

2. (Cancelled).

3. (Currently Amended) The method as defined in Claim 1, wherein the algorithm to determine the status of the system is

$$K = \int_0^T Q dt$$

wherein Q is a flow rate, T is the cycle time and K is the diagnostic value.

4. (Currently Amended) The method as defined in Claim 1, further including the step of providing a flow sensor for determining the flow value.

5. (Original) The method as defined in Claim 1, further including the step of providing a PLC for determining the cycle time T.

6. (Original) The method as defined in Claim 1, further including the step of displaying diagnostic information to a user.

7. (Cancelled)

8. (Original) The method as defined in Claim 3, further comprising the step of differentiating the flow rate  $Q$  with respect to time,  $dQ/dt$ , to determine a start and stop time of a movement of an actuator.

9. (Original) The method as defined in Claim 3, further comprising the step of determining a time period for integration by differentiating the flow.

10. (Original) The method as defined in Claim 3, wherein the flow rate is integrated over a time period defined by a start and stop time of a movement of an actuator.

11. (Original) The method as defined in Claim 3, wherein the system includes a fluid power valve operatively connected to a piston driven cylinder and further comprising the step of integrating the flow rate  $Q$  over the time period defined by an actuation of the valve and a return of the piston to an initial position.

12. (Original) The method as defined in Claim 3, further comprising the step of determining the time period  $T$  from a movement of a device in the system and integrating the flow over the time period  $T$ .

13. (Original) The method as defined in Claim 3, further comprising the step of integrating the flow rate  $Q$  over the time period  $T$ , wherein  $T$  equals the time for one complete cycle of the system.

14. (Currently Amended) A method of determining the service life of a cyclic fluid power system comprising the steps of:

determining a flow rate of the cyclic fluid power system;

determining a cycle time of the cyclic system;

integrating the flow rate over the cycle time to determine a diagnostic value; and

comparing the diagnostic value to a predetermined value to determine ~~the~~ an  
operational status of the system relating to the service life of the cyclic fluid power system.

15. (Original) The method as defined in Claim 14 further comprising the steps  
of storing the diagnostic value calculated at a first time period  $T_1$  and comparing the  
diagnostic value at  $T_1$  to the diagnostic value calculated at a second time period  $T_2$  to  
determine a diagnostic value delta,  $\Delta K$ .

16. (Original) The method as defined in Claim 15 further comprising the step  
of calculating a change in cycle time between  $T_1$  and  $T_2$  to obtain a cycle time delta,  $\Delta T$ .

17. (Currently Amended) The method as defined in Claim 16 further comprising  
the step of comparing the diagnostic value delta  $\Delta K$  to the cycle time delta  $\Delta T$  to determine a  
the system operational status.

18. (Currently Amended) A method of determining the service life of a cyclic  
system comprising the steps of:

sensing a characteristic of the cyclic system to determine a characteristic value;

applying the characteristic value to a first algorithm to determine a beginning  $T_1$  and  
an end  $T_2$  of a cycle;

subjecting the characteristic value to a second algorithm calculated over  $T_1$  and  $T_2$  to  
determine a diagnostic value  $K$ ; and

comparing the diagnostic value to a set of known values to determine ~~the~~ a  
performance status of the system relating to the service life of the cyclic system.

19. (Original) The method as defined in Claim 18 wherein the characteristic value is a flow rate  $Q$ , and said first algorithm is  $dQ/dt$  and said second algorithm is

$$K = \int_{T_1}^{T_2} Q dt.$$

20. (Currently Amended) An apparatus for determining an operational status of a cyclic fluid power system comprising:

a sensor for sensing a system characteristic wherein the system characteristic is a flow rate;

a calculating unit operatively connected to the sensor, the calculating unit including circuitry for performing a mathematical integration on the flow rate to determine a diagnostic value and comparing the diagnostic value to a predetermined value to determine the service life status of the system; and

a notification device operatively connected to the calculating unit for indicating the service life status of the system.

21. (Cancelled)

22. (Currently Amended) The apparatus as defined in Claim 20 ~~21~~, wherein the calculating unit determines the diagnostic value only based upon the flow rate signal.

23. (Currently Amended) The apparatus as defined in Claim 20 ~~21~~, wherein the circuitry of the calculation unit includes a processor for integrating the system characteristic over time.

24. (Original) The apparatus as defined in Claim 23, wherein the processor is configured to differentiate the system characteristic to determine the values over which the integration of the system characteristic takes place.

25. (Original) The apparatus as defined in Claim 23, wherein the calculating unit is operatively connected to a control device, said control device generating information on the cycle time and the processor using the cycle time information to perform the integration of the system characteristic.

26. (Original) The apparatus as defined in Claim 25, wherein the processor compares the calculated diagnostic value to the predetermined value and generates a notification displayed by the notification device.

27. (Previously Presented) A cyclic fluid power system having an operational status monitor comprising:

a valve in fluid communication with a fluid source;

an actuator operatively connected to the valve;

a sensor for determining a system characteristic wherein the system characteristic is the flow rate;

a calculating unit operatively connected to the sensor, the calculating unit including circuitry for performing a mathematical integration on the system characteristic to determine a diagnostic value and comparing the diagnostic value to a predetermined value to determine the service life status of the cyclic system, wherein the mathematical integration is

$$K = \int_0^T Q dt$$

and wherein Q is the flow rate, T is the cycle time and K is the diagnostic value; and

a notification device operatively connected to the calculating unit for indicating the operational status of the system.

28. (Cancelled)

29. (Currently Amended) The fluid power system as defined in Claim 27 28, wherein the actuator includes a drive component movable from an initial position to an actuated position and back to the initial position, and wherein T equals the time period defined by an actuation of the valve and a return of the actuator to an initial position.

30. (Currently Amended) The fluid power system as defined in Claim 27 28, wherein the actuator includes a drive component movable from an initial position to an actuated position and wherein T equals the time period from when the drive component moves from the initial position to the actuated position.

31. (Previously Presented) A method of determining the service life of a cyclic system comprising the steps of:

determining at least one characteristic of the system to determine a characteristic value;

determining a cycle time of the system;

applying the at least one characteristic value to an algorithm in which the characteristic value is integrated to determine a diagnostic value;

evaluating the diagnostic value over a plurality of system cycles to determine a change in the diagnostic value;

evaluating the cycle time over a plurality of system cycles to determine a change in the cycle time;

comparing the change in diagnostic value to the change in the cycle time to determine the operational status of the system.

32. (New) A method of determining the service life of a fluid power cyclic system comprising the steps of:

Applicants: Förster, et al.  
Serial No.: 10/644,341  
Filing Date: August 19, 2003  
Docket No.: 163-42

determining at least one characteristic of the cyclic system to determine a characteristic value, wherein the characteristic value is a flow rate of the system;

determining a cycle time of the cyclic system;

applying the flow rate to an algorithm in which the characteristic value is integrated over the cycle time to determine a diagnostic value;

evaluating the diagnostic value over a plurality of system cycles to determine a change in the diagnostic value;

evaluating the cycle time over a plurality of system cycles to determine a change in the cycle time; and

comparing the change in diagnostic value to the change in the cycle time to determine the operational status of the system.
